

2D $[^{15}\text{N}-^1\text{H}]$ HSQC spectra of an intrinsically disordered protein recorded at pH 2.0 and 298 K on a Bruker Avance 800 MHz

Himanshu Singh, PhD, 2016

Department of Organic Chemistry | Ludwig-Maximilians-University

Field strength: 800 MHz

Why is this your favorite spectrum?

2D $[^1\text{H}-^{15}\text{N}]$ resonances of an intrinsically disordered protein were joined together to make an interesting art. After joining most of the resonances, the spectrum produces images of an alien walking under clouds. This looks very interesting and fits well with the subject of this NMR art competition.
